Mattress Selection Algorithm

This algorithm is meant as a guide, not a substitute for clinical judgment. It should be used only as an adjunct to a full patient assessment and should not preclude the use of any product positioned higher in the algorithm. The pressure injury risk assessment tools suggested in this algorithm should not supersede clinical judgment, nor should they be considered a stand-alone indicator for implementing pressure relief devices.

Pressure Risk Assessment Criteria:

(Rate each from 1-4)

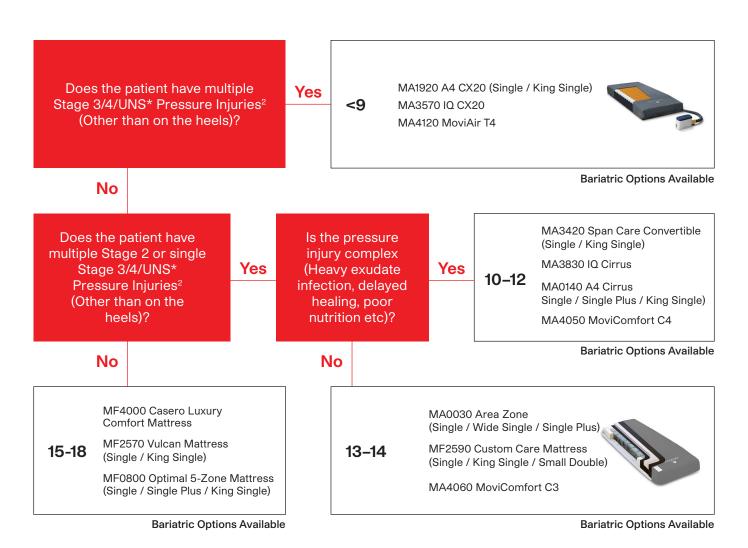

- 1 = Completely Limited
- 4 = No Impairment

- 1 = Bedfast
- Nutrition
- Friction & Shear

- 1 = Constantly Moist
- 4 = Rarely Moist
- 4 = Walks Frequently
- 1 = Very Poor
- 4 = Excellent
- 1 = Problem
- 3 = No Apparent Problem

Pressure Risk Assessment Criteria:

Score

15-18 Mild Risk

13-14 Moderate Risk

10-12 High Risk

<9 Severe Risk

Note:

- 1. In situations where positioning on the pressure injury cannot be avoided (e.g., the individual has multiple injuries on multiple surfaces), limit the amount of time the individual is positioned on the injury.
- 2. Heel injuries are difficult to heal and should be elevated off the bed. Consider using a heel manager.
- Ultramax may also be appropriate for multiple Stage 2 or single Stage 3
 pressure injuries, and Max, Plus, or Pro may be appropriate for single
 Stage 2 pressure injuries—based on a full assessment of skin status and
 the repositioning required, according to best clinical practice and judgment.
